CONCLUSIONS

This report indicates some more improvement from previous report and it demonstrate continuous effort and commitment to improve blood transfusion practices throughout the Trust. Many clinical areas are taken the issues of blood transfusion very serious and as such there have been fewer incidents during this period, in fact there was an increased number of near miss incidents detected on the wards as a results of good final patient identity check carried out by our nurses/midwives in clinical areas.

With the current training provision, majority of our medical staff that prescribe blood were unable to receive the required blood transfusion training. It is felt that this essential training should be recognise by each Medical Education Supervisor and to ensure that junior doctors under their supervision participate in the new transfusion-training programme.

It is hope that all the key stakeholders within the Trust will give their full support and cooperation for a successful implementation of the proposed training programme.
